

GAME ALGORITHM

Alexander Palomba

- ▶ We've probably all gotten buyer's remorse at least once
- ▶ Becoming increasingly common in video game market
 - ▶ Pre-Order Bonuses
 - ▶ Review Embargoes
 - ▶ Release Day Bugs
 - ▶ EA

INTRODUCTION

- ▶ User will input a game, and some simple info about it, and the algorithm will determine whether the user should:
 - ▶ Purchase the game
 - ▶ Wait to purchase the game until the price drops/until more information is available
 - ▶ Consider other games similar to the one in question, or
 - ▶ Not purchase the game

ABSTRACT

- ▶ Step 1: Enter game info
 - ▶ Genre
 - ▶ Critical Score out of 10
 - ▶ User Score out of 10
 - ▶ Publisher Score out of 10
- ▶ Step 2: Compare game to other games in user's library (same genre)
 - ▶ Convert into score out of 10
- ▶ Step 3: Analyze average amount of hours played in that genre
 - ▶ Convert into score out of 10
- ▶ Step 4: Average the scores
- ▶ Insufficient data = 5/10

METHOD

- ▶ The game will be compared to the user's library based on two parameters:
 - ▶ Genre
 - ▶ Hours Played
- ▶ Machine Learning algorithm will be used to linearly separate data
 - ▶ How many games in library are same genre as game in question
 - ▶ How many hours have these games been played in total compared to games of other genres
- ▶ Game will be scored on a scale of 1 to 10, which will be averaged with the other scores
 - ▶ 1 = Completely dissimilar from library and/or barely any user playtime in this genre
 - ▶ 10 = Same genre as most of library and/or majority of user playtime in this genre

WHERE DOES AI COME IN?

- ▶ The average of the scores from the previous steps
- ▶ The final score will be determined as follows:
 - ▶ 0-2 = User should not purchase game
 - ▶ 3-4 = User should reconsider desire to purchase game
 - ▶ 5-6 = User should wait for reduced price/explore other similar titles
 - ▶ 7-9 = User should purchase the game

FINAL SCORE

- ▶ My Steam library (~70 games)
- ▶ My friends' Steam libraries (31 friends with ~10-150 games each)
- ▶ Still not enough? Randomly generate data

DATA

Several white lines of varying lengths and slopes are positioned in the bottom right corner of the slide, creating a modern, abstract graphic element.

- ▶ Final Fantasy XV just came out. Is it worth buying? Let's find out:

EXAMPLES/EXPERIMENTS

- ▶ Genre: RPG
- ▶ Critical Score: 8/10 (*Source: Metacritic.com*)
- ▶ User Score: 8/10 (*Source: Metacritic.com*)
- ▶ Publisher: Square Enix, 7/10 (*Source: Metacritic.com*)
- ▶ Library: Out of the 70 or so games I own, only about 8 are RPGs, 1.1/10*
- ▶ I've played these 8 games collectively about 75 hours, 7.5/10*
- ▶ Final Score: 6.32/10
- ▶ Consensus: I should probably wait for the game to go on sale.

*these are stand-in examples, actual scores will be determined by PLA

EXAMPLES/EXPERIMENTS

▶ Mafia III

- ▶ Genre: Action
- ▶ Critical Score: 7/10
- ▶ User Score: 5/10
- ▶ Publisher Score: 7/10
- ▶ Library: The majority of games I own are in the Action genre, 8/10
- ▶ Hours played: Hundreds, 10/10
- ▶ Final Score: 7.4

EXAMPLES/EXPERIMENTS

- ▶ Forza Horizon 3
 - ▶ Genre: Racing
 - ▶ Critical Score: 9/10
 - ▶ User Score: 8/10
 - ▶ Publisher Score: 7/10
 - ▶ Library: I don't own any racing games, 0/10
 - ▶ Hours played: 0/10
 - ▶ Final Score: 4.8

EXAMPLES/EXPERIMENTS

- ▶ Algorithm appears to be heavily swayed by contents of user's library
 - ▶ Machine learning should result in more accurate results
- ▶ Current framework: pocket algorithm
- ▶ Python is hard
 - ▶ Still working on code
 - ▶ See picture →

CONCLUSIONS
